

Invoice Matching and Exception Management Policy

Policy ID	AP-001
Version	2.5
Effective date	01 June 2026
Owner	Procurement and Finance Governance
Approved by	Chief Financial Officer

1. Scope

This policy applies to supplier invoices processed against purchase orders, goods receipts, service confirmations, and approved non-purchase-order arrangements.

2. Three-way match

For goods, the invoice must be matched to the purchase order and goods receipt. Invoice quantity must not exceed accepted received quantity. Invoice unit price must not exceed the purchase order price beyond the approved tolerance.

3. Price tolerance

A price variance of up to 2 percent may be accepted when the total financial impact is below LKR 25,000 and the purchase order remains open. Any larger variance requires procurement review and documented approval.

4. Quantity tolerance

There is no automatic tolerance for invoicing above accepted receipt quantity. Such invoices must be held pending an additional receipt, correction, or authorised exception.

5. Tax validation

The invoice tax treatment must be consistent with the supplier master and the applicable tax rule configured in the finance system. A mismatch must be reviewed before posting.

6. Duplicate controls

The system must check supplier, invoice number, invoice date, gross amount, currency, purchase order, and payment status. An exact supplier and invoice-number match within twenty-four months must be blocked until reviewed.

7. Missing purchase order

An invoice without a required purchase order reference must be returned for clarification or routed through the approved non-purchase-order process. The system must not invent a purchase order reference.

8. Bank-detail changes

A bank account shown on an invoice is not sufficient authority to change the vendor master. The invoice must be held if remittance details differ from the verified supplier record until independent verification is completed.

9. Human approval

Release of a material exception, duplicate override, tax override, non-purchase-order approval, and payment-related action requires an authorised human decision.

10. Audit trail

The case must record source documents, matching results, exception calculations, policy references, communications, reviewer decision, and any posting or integration result.
